

User Acceptance Testing (UAT) & Sprint Sign-Off

Document ID: UAT-PI1-SR3

Completion Date: May 2026

Cycle Status: 100% Approved

This report documents the formal validation parameters and User Acceptance Testing (UAT) outcomes for Phase 1 of the Retail Analytics Platform. All core features delivered across Sprints 1 through 3 have been rigorously cross-verified against the baseline Business Requirements Document (BRD) and are officially accepted by business stakeholders.

1. Executive Summary & Sprint Metrics

Over the course of a 3-sprint Agile production cycle, the scrum team translated high-level strategic expectations into functional data deliverables. A total of **20 Story Points** were successfully developed, verified against our engineering Definition of Done (DoD), and demoed during the Sprint Review sessions.

2. Functional UAT Test Execution Matrix

The business analyst team conducted testing scenarios mapped directly to the 6 production dashboard layouts to ensure semantic precision and filter fluidity.

Test ID	Dashboard Sheet Tested	Functional Criteria Verified	UAT Status
TC-01	1. AOV & Profit Margin	Verified that explicit DAX measures compute multi-channel Average Order Value and profit retention bounds flawlessly without implicit context errors.	PASSED
TC-02	2. Bottom Line & Top Line Matrix	Validated that the relational star schema rolls up Gross Sales, COGS, and Net Revenue perfectly across data silos without inflating row values.	PASSED
TC-03	3. Return Rate Analytics	Confirmed the comparative Return Rate2 metric correctly tracks risk relative to Electronics and flags the **Grocery Division** as a structural margin trap.	PASSED
TC-04	4. Age Group Analysis	Verified that the customer age bands accurately isolate demographic spend volume into clean 10-year tiers with zero string syntax bugs.	PASSED

Test ID	Dashboard Sheet Tested	Functional Criteria Verified	UAT Status
TC-05	5. Avg Order Frequency by State	Confirmed that regional field managers can apply geographic filters smoothly without creating blank calculation rows or context fractures.	PASSED
TC-06	6. Electronic Sales Deep-Dive	Validated that granular procurement metrics partition perfectly across Audio, Laptops, and Mobile categories to protect tracking of the 88.37% core revenue engine.	PASSED

3. Quality Assurance & Defect Remediation Log

During Sprint 3 execution, a critical calculation defect was identified in the customer demographic sorting layer (Defect ID: DEF-08). The expression engine was evaluating text strings as mathematical subtractions, throwing negative metrics. The team successfully refactored this logic utilizing an optimized SWITCH(TRUE()) DAX syntax block, clearing all blocking issues before the final deployment review.

4. Strategic Retrospective Directive (Phase 2 Roadmap)

While the local Excel Power Pivot layout successfully validated the business case logic, the final Sprint 3 Retrospective identified major scaling constraints. The local flat-file storage cannot sustain automated cloud gateways, multi-user concurrency, or row-level data access security.

Approved Retrospective Action: Officially sign off on the Phase 1 prototype and authorize immediate transition to ****Phase 2 (Repository 2)****: Establish an enterprise relational SQL Server database architecture and deploy production-grade visualization sets via Power BI Premium.

5. Formal Stakeholder Acceptance Sign-Off

By signing below, leadership formally acknowledges full acceptance of Phase 1 functional delivery and approves the strategic engineering migration to the SQL Server ecosystem.
